Particular aspects of coagulation. Mitsuaki ~~SHOEN~~ MITSUKAWA, Maria Tekau-Oberstein, and E. Mitsuaki. ~~Comm. and~~ *rep. popularis Romica* 6, 1150-54 (1956).—In 47 clinical observations of cases of thrombosis, hepatic cirrhosis and rheumatic disease the blood showed hypercoagulability and a deficit of prothrombin. This paradox is explained by the hypothesis that the fibrinogen is transformed by bacterial endotoxins or through diathesis into fibrin without the intervention of specific enzymic clotting factors. In this

way it is possible to establish a class of thromboses in which treatment with anticoagulants is ineffective. A. Halar.

EXCERPTA MEDICA Sec.2 Vol.11/5 Physiology, etc. May 58

2981. RESEARCH ON OESOPHAGEAL PHYSIOLOGY - Cercetări referitoare la fiziologia esofagului - Stoichiță S. - REV. FIZIOL. NORM. PATOL. 1957, 4/4 (310-319) Graphs 6

The physiology of deglutition was studied by recording, with a combination of manometers, the motility of the oesophagus at various levels and of the stomach, in addition to respiratory movements and tipping movements of the larynx (the latter with a small, external balloon applied to the neck at the level of the larynx and connected to a writing manometer). The results (some of which have been published elsewhere) are summarized. The negative wave of the oesophagogram is ascribed to the action of the negative pressure of respiratory aspiration on the walls of the oesophagus. The primary peristalsis (deglutition waves) is preceded by a tipping movement of the larynx, as inscribed on the laryngogram. The secondary peristalsis represents autonomous contractions - true oesophageal waves - which sometimes coincide with the gastric contractions and which do not have any important propulsive role. As regards the problem of the cardiac sphincter, the experimental findings suggest that the peristaltic waves alone are not sufficient to account for the opening of the digestive sphincters and that reflexes depending on the quality of the alimentary stimulus play an important part. In connection with the influence of the nervous system, 2 new reflexes are described: a gastro-oesophageal inhibitor reflex which appears after direct stimulation of the stomach and the natural oesophagomotor conditioned reflex which appears spontaneously when food is the subject of conversation or the subject is placed in an environment associated with food.

"Changes in Phagocytic Activity of Leukocytes Following Exchange Transfusion with Blood-Dextran Mixture."

Sofia, Ekperimentalna Meditsina i Morfolozhiya, Vol 1, No 3, 1962; pp 11-16.

Abstract: [English summary modified]: In 6 dogs, exsanguinotransfusion with donor blood - dextran mixture; phagocytability studied of injected killed *Staphylococcus aureus* at 0, 6h. and 1, 3, 6, 10, 15, 20 and 30 days thereafter. Phagocytic activity was lowest 6 days after the transfusion, nearly normal 30 days after it. Graph, 2 photomicrographs, 2 tables; 4 Soviet, 2 bulgarian and 3 Western references.

1147. Fluorescence and Phosphorescence Phenomena of Aragonite-Like Calcites. S. v. Gilescynski and E. Stolicovici. *Zem. f. Krut.* 94. 4. pp. 344-350, 1937 -- Calcites from Coruna in Rumania have been examined, which show wonderful colour bands in all shades from purest white to deepest black. In previous work these calcites have been classified as aragonite, but a series of X-ray diagrams showed only a calcite and never an aragonite type of structure. The X-ray and u.v. phosphorescence and fluorescence phenomena have been studied for about 80 different specimens. The light phenomena increase for these radiations with the deepening of the daylight colour of the sample. The u.v. fluorescence is generally light violet, the u.v. phosphorescence, green or grey; the X-ray fluorescence is of either a greenish or reddish colour, and the phosphorescence is of corresponding colour. There seems to be no correlation between the nature of the materials and the light phenomena that they show.

The effects of strephanthin and of the venom of the wasp
Crabro on the melanophores of *Cataglyphis savignyi*. I. A.
Bou and Pierre Stenmark. *Ann. Rep. Progres Acad.
Sci. Strasbourg* 72 (1969) French summary.
Strephanthin (I) added to saline irrigated scales of
Crabro produces a contraction of the melanophores (II).
The speed of the contraction depends on the concentration of I
the activity of which is complete and irreversible. By
treating the II with atropine I will produce no contrac-
tion. It appears that II is under the control of the para-
sympathetic nervous system. The contractions of the II
produced by strephanthin injections are not sharp but in the
region of the injection the color of the scales gets light by an
irreversible contraction of II. The venom of the wasp
Crabro produces a reversible contraction on the II of *Cataglyphis*
due to a still unknown factor. Emanuel Merdinger
